

Advantages of using ElectricIR™

- Reduce Downtime
- Increase Equipment Life
 - Lower Risks
- Comply With Electric Code
 - Lower Repair Costs
 - Increase Profits
 - Save On Insurance
- Prevent Catastrophic Failures
 - Save Lives!

Take advantage of Electrical Infrared Thermographic Surveys to increase uptime, productivity and profitability.

safety and dollars
are the bottom line

If you are a facility manager, maintenance manager, building owner...responsible for safety, production and repair at your facility, you cannot afford to be without a regular infrared (IR) thermographic survey of your electrical switchgear, distribution system and mechanical equipment.

The National Fire Prevention Association (NFPA) code 70B §21.17.5 suggests that every commercial and industrial building in the United States should have an IR survey at least once a year.

Increasingly... Insurance companies are requiring IR surveys of electrical and mechanical systems for their insured. Some companies may even offer discounts if you have the surveys performed.

Infrared Predictive Maintenance Explained

Infrared thermography is used to perform P/PM inspections on electrical equipment because excess resistance on electrical apparatus indicates electrical faults such as loose connections, overloaded or imbalanced circuits, faulty breakers, damaged switches, faulty fuses and a wide range of other unwanted electrical conditions.

Before an electrical component burns up, it heats up. Thermography is used to see the excess heat (resistance) so that problems can be found and maintenance personnel can act to correct the problem before the component fails, causing damage to the component, safety hazards and/or production downtime.

ElectricIRTM surveys are fast and **cost effective**. This is **non-destructive** technology which causes no disruption of service... **no shut down is required!**
